*This document complements the analysis of the paper presenting additional results and examples.

¹The results reported in this Section have been obtained starting from the model presented in the paper setting $\Gamma_0 = \Gamma_1 = \Gamma_2 = 0$ and leaving all the other parameters at their baseline values (see Table 1 of the main text). In this case the level of economic activity will be higher than that reported in Table 2 of the main text.

³The results reported in this Section have been obtained starting from the model presented in the paper setting the net markup and the probability that prices stay unchanged at zero, while leaving all the other parameters at their baseline values (see Table 1). In this case the level of economic activity will be higher than that reported in Table 2 of the main text.

⁴The results reported in this Section have been obtained starting from the model presented in the paper setting the net markup, the probability that prices stay unchanged and the adjustment cost on capital at zero, while leaving all the other parameters at their baseline values (see Table 1). In this case the level of economic activity in steady state will be as in Table S.8.

Table S.13: Standard Deviations

⁵The results reported in this Section have been obtained starting from the model presented in the paper, setting the net markup, the probability that prices stay unchanged and the adjustment cost on capital at zero, while leaving all the other parameters at their baseline values (see Table 1). In addition, we have excluded monetary policy. In this case the level of economic activity in steady state will be as in Table S.8.
